Generative AI Use – Tasks 4 and 5

I used ChatGPT as a learning and troubleshooting assistant while completing Tasks 4 and 5 of INF201 Deliverable 2.

Task 4 – Pandas Data Analysis

I asked ChatGPT questions about how to convert transaction data into a Pandas DataFrame, calculate hourly revenue, create a pivot table, and calculate refund ratios using the function from Task 3.

ChatGPT helped me understand the code, review the results, and improve the function docstrings and Results and Discussion section.

Task 5 – Full Workflow

I asked ChatGPT how to combine the functions from Tasks 1–4 into a complete workflow, apply price outlier cleaning, correct NOK prices, and generate the required reports.

ChatGPT provided explanations and code suggestions, helped me troubleshoot and verify the results, and assisted with code comments and documentation.

My Contribution

I worked through the tasks step by step, executed the code in VS Code, checked the generated results, and made the final changes. I used ChatGPT for explanations, code suggestions, and writing assistance, but reviewed and tested the final solution myself.
